

## IEEE - DBIT WEBSITE

Initial Plan: website using WordPress

1. WordPress website can be easily hacked.
2. WordPress is still a slow platform due to the all the added plugins, oversaturated databases, and codebases.
3. WordPress only offers limited SEO optimizing features in its packages.
4. Websites can go down for many reasons without notice.
5. If you aren't paying attention to your site, you may not realize it is down. It could be down for a couple of hours or even days.

***Because of these reasons we decided to go for a Hardcode website using HTML, CSS, JS, REACTJS, NODEJS, etc***

Current Status:

Core members busy with their BE project, Entrance preparation, Placement Cell activities, etc.

80% website should be ready by beginning of next semester.

Most of the website team members are well versed with HTML, CSS, JS

And as far as the technologies are concerned, if they don't know any particular language, they will learn the same during the website development process.
